

What 100 Universities (Say They) Teach

A cro

Abstract

This report extends the catalog-language analysis of Marinovic (2026), "What Universities (Say They) Teach," from its original 16-university comparison set to 100 U.S. institutions. Following the reference methodology, each course title and description is searched for two keyword families: a progressive signal (race, gender, identity, diversity, equity, social justice, decolonial, and related themes) and a Western-canon signal (classical antiquity, the Western intellectual tradition, canonical authors and texts). For the 84 newly collected institutions the report uses the most recent published catalog (mostly 2026-2027); for the 16 reference institutions it cites the shares reported in Marinovic (2026). Across the 84 freshly scraped catalogs - 434,364 deduplicated courses - the course-weighted progressive signal is 10.0% and the Western-canon signal is 2.8%. The central pattern of the original paper holds in the far larger sample: the progressive signal exceeds the Western-canon signal at 97 of 100 institutions, typically by a factor of three to four. The signal is far from uniform - progressive shares range from under 1% to over 34% - and the few institutions where the canon signal dominates are Christian colleges or low-signal outliers. These measures are mechanical keyword counts, not judgments about course quality or what is taught in classrooms.

1. Introduction

Marinovic (2026) measures how often U.S. university course catalogs use language associated with progressive themes versus the Western canon, documenting a steady rise in the progressive signal alongside a flat-to-declining canon signal, drawing its cross-sectional comparisons from sixteen major research universities. This report keeps the method fixed and asks a simpler question: what does the same measurement look like across a much wider slice of American higher education?

The 100 institutions here are deliberately heterogeneous - private research universities, large public flagships, regional public universities, technical institutes, religious colleges, and community colleges. The original sample explicitly omitted community colleges, regional public universities, and most liberal-arts colleges; this extension fills in exactly those gaps. The cost is that catalog coverage and description quality vary more across this sample than within the original sixteen. As in the reference report, this is a descriptive exercise: it asks only how often certain themes appear in the official language by which universities describe their courses.

2. Data and Method

Coverage. The report combines (i) 84 newly collected catalogs scraped from each institution's current public catalog - almost all 2026-2027 - parsed into a common schema and containing 434,364 deduplicated courses; and (ii) 16 reference catalogs from Marinovic (2026), whose latest-year progressive and Western-canon shares are reproduced from Table 6 of that paper (2024 or 2025 catalogs).

Keyword matching. Matching is case-insensitive and uses the same progressive and Western-canon keyword lists as the reference paper. A course carries a signal if its combined title-plus-description contains at least one keyword from the corresponding list. Cross-listed duplicates are collapsed to one course-year before any share is computed. The two signals are not mutually exclusive.

Three caveats specific to this extension: (1) Single-year snapshot - the 84 new institutions are observed in one recent catalog year, so this is a cross-section, not a panel, and cannot speak to trends over time. (2) Coarser area classification - broad areas are assigned by a mechanical department/title keyword map, so the residual "Other" category is large and should be read as "unclassified." (3) No enrollment weights - all shares are unweighted course counts, the same basis the reference paper uses for cross-university comparison.

3. Headline Findings

- The progressive signal dominates the canon signal almost everywhere. At 97 of 100 institutions the progressive share exceeds the Western-canon share. Across the 84 scraped catalogs the course-weighted progressive signal (10.0%) is about 3.6x the canon signal (2.8%).
- Typical magnitudes are lower than the elite sample. The median institution carries the progressive signal on 9.2% of

courses and the canon signal on 2.2%. The most progressive elite catalogs (Yale 21.7%, U. Chicago 28.3%) sit in the upper tail of the full distribution, not at its center.

- Enormous dispersion. Progressive shares span roughly 0.6% to 34%. The spread is institutional, not just disciplinary: regional and technical schools cluster low, while research universities and several small private colleges cluster high.

- Where the canon wins, it is usually religious. Only three institutions carry more canonical than progressive language: Biola and Cornerstone (Christian colleges), and Marshall, an outlier whose 0.6% progressive share reflects short, sparse catalog descriptions rather than a canon-heavy curriculum.

- Climate language is modest but pervasive. Across scraped catalogs the narrow climate signal averages 0.6% of courses and the broad climate-or-sustainability signal 2.9%.

Figure 1. Each point is one institution's latest catalog. Points above the dashed line carry more progressive than canonical language. Red = 16 reference institutions (Marinovic 2026); blue = 84 newly collected catalogs.

Figure 2. Distribution of progressive and Western-canon shares across all 100 institutions. Dashed lines mark the means.

4. Cross-Sectional Comparison (all 100 institutions)

Table 1 reports every institution's latest-catalog progressive and Western-canon shares, the ratio between them, and the number of courses analyzed. As in Table 6 of the reference paper, institutions are sorted from the highest progressive-to-canon ratio to the lowest.

* For the 16 reference institutions (src=pap) the course count is the total course-years in Marinovic (2026), not a single-year count; shares are latest-year (2024/2025) values from that paper. Scraped counts (src=sc) are deduplicated single-year (mostly 2026-2027).

Progressive Signal Ranking, 100 Universities

Figure 3. The twenty highest and twenty lowest institutions by progressive share.

5. Catalog Composition

Universities differ in the mix of courses they offer, which shapes baseline exposure to each keyword list. The table below aggregates broad-area composition across the 84 scraped catalogs. The large "Other" share reflects the coarse keyword-based area classifier used in this extension and should be read as "unclassified."

Broad area	Courses	Share of catalog
Humanities	73,452	16.6%
Social Sciences	36,751	8.3%
STEM	78,121	17.6%
Medical Sciences	17,635	4.0%
Professional	34,894	7.9%
Other	201,803	45.6%
Total	442,656	100.0%

In the reference paper the progressive signal concentrates in the Social Sciences and Professional schools, the canon signal in the Humanities, and both are lowest in STEM. The institution-level results are consistent with that pattern: the highest progressive shares are humanities- and social-science-heavy private colleges and flagships, the lowest are technical and applied institutions.

6. Climate-Related Language

Following Appendix C of the reference paper, climate language is measured separately. A narrow signal captures climate change, global warming, greenhouse gas, carbon emissions, and similar; a broad signal adds sustainability, renewable energy, and clean energy. The fifteen scraped institutions with the highest broad climate share are shown below.

#	University	Narrow %	Broad %
1	U. New England	2.3	8.5
2	Notre Dame	3.4	7.1
3	CU Boulder	1.4	6.1
4	Cal Poly SLO	1.3	5.9
5	Iowa State	0.8	5.8
6	Virginia Tech	1.0	5.8
7	Texas State	0.2	5.7
8	Oregon State	1.2	5.6
9	U. Alaska Fairbanks	1.2	5.5
10	U. Idaho	0.5	5.2
11	U. Idaho (UG)	0.5	5.2
12	Dartmouth	2.0	5.2
13	U. Miami	1.0	4.7
14	Penn State	1.0	4.5
15	NC State	0.6	4.5

Figure 4. Top 20 scraped institutions by broad climate-or-sustainability share; dark bars show the narrow climate-change signal within each.

7. Limitations and Conclusion

Catalogs are not classrooms: keyword counts on public descriptions do not reveal what is assigned, how a course is taught, or what students learn. Keyword lists produce false positives (equity in finance, diversity in biology, classical in physics) and false negatives (themes discussed without the listed words). These institutions are observed once and weighted by course count, not student seats. Coverage is uneven - some catalogs omit departments that failed to scrape, recorded per-institution in each summary file.

Extending the measurement from 16 to 100 institutions does not overturn the central finding of Marinovic (2026): progressive language is far more common than Western-canon language in the stated curriculum, dominating at 97 of 100 schools. What the wider sample adds is context for magnitude. The very high progressive shares of the most-discussed elite catalogs are not representative of American higher education as a whole; the median institution sits near 9%, with a long tail of regional, technical, and religious institutions below that. The institutions where the canon still leads are a small, distinctive group - Christian colleges, plus one low-signal outlier. As in the original, these are rough, comparable signals offered for transparency and replication, not verdicts on any institution.
